

## 1z0-067 Dumps

### Upgrade Oracle9i/10g/11g OCA to Oracle Database 12c OCP

<https://www.certleader.com/1z0-067-dumps.html>

**NEW QUESTION 1**

For which three pieces of information can you use the RMAN list command?

- A. stored scripts in the recovery catalog
- B. available archived redo log files
- C. backup sets and image copies that are obsolete
- D. backups of tablespaces
- E. backups that are marked obsolete according to the current retention policy

**Answer:** ABD

**Explanation:**

About the LIST Command: The primary purpose of the LIST command is to list backup and copies. For example, you can list: -Backups and proxy copies of a database, tablespace, datafile, archived redo log, or control file -Backups that have expired -Backups restricted by time, path name, device type, tag, or recoverability -Archived redo log files and disk copies [http://docs.oracle.com/cd/B28359\\_01/backup.111/b28270/rcmreprt.htm#BRADV89585](http://docs.oracle.com/cd/B28359_01/backup.111/b28270/rcmreprt.htm#BRADV89585)

**NEW QUESTION 2**

You want to export the pluggable database (PDB) hr\_pdb1 from the multitenant container database (CDB)CDB1 and import it into the cdb2 CDB as the emp\_pdb1 PDB.

Examine the list of possible steps required to perform the task: 1.Create a PDB named emp\_pdb1.

2.Export the hr\_pdb1 PDB by using the full clause. 3.Open the emp\_pdb1 PDB.

4. Mount the emp\_pdb1 PDB.

5. Synchronize the emp\_pdb1 PDB in restricted mode. 6.Copy the dump file to the Data Pump directory.

7.Create a Data Pump directory in the emp\_pdb1 PDB. 8.Import data into emp\_pdb1 with the full and remap clauses.

9.Create the same tablespaces in emp\_pdb1 as in hr\_pdb1 for new local user objects. Identify the required steps in the correct order.

- A. 2, 1, 3, 7, 6, and 8
- B. 2, 1, 4, 5, 3, 7, 6, 9, and 8
- C. 2, 1, 3, 7, 6, 9, and 8
- D. 2, 1, 3, 5, 7, 6, and 8

**Answer:** C

**Explanation:**

Because the step 2 says that you perform an expdp with the full clause and you don't need to create the tablespaces when you perform the impdp. FULL=yes will export tablespace definitions. So no need step 9. [https://docs.oracle.com/cd/B10501\\_01/server.920/a96652/ch01.htm](https://docs.oracle.com/cd/B10501_01/server.920/a96652/ch01.htm)

**NEW QUESTION 3**

A database is running in archive log mode. The database contains locally managed tablespaces. Examine the RMAN command:

RMAN> BACKUP

AS COMPRESSED BACKUPSET SECTION SIZE 1024M DATABASE;

Which statement is true about the execution of the command?

- A. The backup succeeds only if all the tablespaces are locally managed.
- B. The backup succeeds only if the RMAN default device for backup is set to disk.
- C. The backup fails because you cannot specify section size for a compressed backup.
- D. The backup succeeds and only the used blocks are backed up with a maximum backup piece size of 1024 MB.

**Answer:** D

**Explanation:**

COMPRESSED enables binary compression.  
RMAN compresses the data written into the backup set to reduce the overall size of the backup set. All backups that create backup sets can create compressed backup sets. Restoring compressed backup sets is no different from restoring uncompressed backup sets.  
RMAN applies a binary compression algorithm as it writes data to backup sets. This compression is similar to the compression provided by many media manager vendors. When backing up to a locally attached tape device, compression provided by the media management vendor is usually preferable to the binary compression provided by BACKUP AS COMPRESSED BACKUPSET.  
Therefore, use uncompressed backup sets and turn on the compression provided by the media management vendor when backing up to locally attached tape devices. You should not use RMAN binary compression and media manager compression together.  
Some CPU overhead is associated with compressing backup sets. If the target database is running at or near its maximum load, then you may find the overhead unacceptable. In most other circumstances, compressing backup sets saves enough disk space to be worth the CPU overhead.  
SECTION SIZE sizeSpec Specifies the size of each backup section produced during a data file backup. By setting this parameter, RMAN can create a multisection backup. In a multisection backup, RMAN creates a backup piece that contains one file section, which is a contiguous range of blocks in a file. All sections of a multisection backup are the same size. You can create a multisection backup for a data file, but not a data file copy.  
File sections enable RMAN to create multiple steps for the backup of a single large data file. RMAN channels can process each step independently and in parallel, with each channel producing one section of a multisection backup set.  
If you specify a section size that is larger than the size of the file, then RMAN does not use multisection backup for the file. If you specify a small section size that would produce more than 256 sections, then RMAN increases the section size to a value that results in exactly 256 sections. Depending on where you specify this parameter in the RMAN syntax, you can specify different section sizes for different files in the same backup job.  
Note: You cannot use SECTION SIZE with MAXPIECESIZE or with INCREMENTAL LEVEL 1.2018-04- 01T21:58:00.52<!--EndFragment-->

#### NEW QUESTION 4

In your database, the tbs percent used parameter is set to 60 and the tbs percent free parameter is set to 20.  
Which two storage-tiering actions might be automated when using Information Lifecycle Management (ILM) to automate data movement?

- A. The movement of all segments to a target tablespace with a higher degree of compression, on a different storage tier, when the source tablespace exceeds tbs percent used
- B. Setting the target tablespace to read-only after the segments are moved
- C. The movement of some segments to a target tablespace with a higher degree of compression, on a different storage tier, when the source tablespace exceeds TBS percent used
- D. Taking the target tablespace offline after the segments are moved
- E. The movement of some blocks to a target tablespace with a lower degree of compression, on a different storage tier, when the source tablespace exceeds tbs percent used

**Answer:** BC

```

The threshold for activating tiering policies is based on two parameters: TBS PERCENT USED  
TBS PERCENT FREE

Both values can be controlled by the DBMS\_ILM\_ADMIN package.

TBS PERCENT USED and TBS PERCENT FREE default to 85 and 25, respectively. Hence, whenever the source tablespace's usage percentage goes beyond 85 percent, any tiering policy specified on its objects will be executed and objects will be moved to the target tablespace until the source tablespace becomes at least 25 percent free. Note that it is possible to add a custom condition to tiering policies to enable movement of data based on conditions other than how full the tablespace is.

In addition, the READ ONLY option must be explicitly specified for the target tablespace. 2018-04-01T21:59:00.56<!--EndFragment-->

#### NEW QUESTION 5

Which two statements are true when row-archival management is enabled?

- A. Visibility of the ORA\_ARCHIVE\_STATE column is controlled by the row archival visibility session parameter.
- B. The ORA\_ARCHIVE\_STATE column is updated manually or by a program that can reference activity tracking columns, to indicate that a row is no longer considered active.
- C. The row archival visibility session parameter defaults to all rows.
- D. The ORA\_ARCHIVE\_STATE column is visible if it is referenced in the select list of a query.
- E. The ORA\_ARCHIVE\_STATE column is updated automatically by the database based on activity tracking columns, to indicate that a row is no longer considered active.

**Answer:** BD

#### NEW QUESTION 6

You want to capture column group usage and gather extended statistics for better cardinality estimates for the customers table in the SH schema.

Examine the following steps:

1. Issue the SELECT DBMS\_STATS.CREATE\_EXTENDED\_STATS('SH', 'CUSTOMERS') from dual statement.
2. Execute the dbms\_stats.seed\_col\_usage (null, 'SH', 500) procedure.
3. Execute the required queries on the customers table.
4. Issue the select dbms\_stats.report\_col\_usage('SH', 'customers') from dual statement. Identify the correct sequence of steps.

- A. 3, 2, 1, 4
- B. 2, 3, 4, 1
- C. 4, 1, 3, 2
- D. 3, 2, 4, 1

**Answer:** B

#### Explanation:

Step 1 (2). Seed column usage

Oracle must observe a representative workload, in order to determine the appropriate column groups. Using the new procedure DBMS\_STATS.SEED\_COL\_USAGE, you tell Oracle how long it should observe the workload.

Step 2: (3) You don't need to execute all of the queries in your work during this window. You can simply run explain plan for some of your longer running queries to ensure column group information is recorded for these queries.

Step 3. (1) Create the column groups

At this point you can get Oracle to automatically create the column groups for each of the tables based on the usage information captured during the monitoring window. You simply have to call the DBMS\_STATS.CREATE\_EXTENDED\_STATS function for each table. This function requires just two arguments, the schema name and the table name. From then on, statistics will be maintained for each column group whenever statistics are gathered on the table. Note:

\* DBMS\_STATS.REPORT\_COL\_USAGE reports column usage information and records all the SQL operations the database has processed for a given object.

\* The Oracle SQL optimizer has always been ignorant of the implied relationships between data columns within the same table. While the optimizer has traditionally analyzed the distribution of values within a column, he does not collect value-based relationships between columns.

\* Creating extended statistics

Here are the steps to create extended statistics for related table columns with dbms\_stats.create\_extended\_stats:

1 - The first step is to create column histograms for the related columns.

2 – Next, we run dbms\_stats.create\_extended\_stats to relate the columns together.

Unlike a traditional procedure that is invoked via an execute ("exec") statement, Oracle extended statistics are created via a select statement.

#### NEW QUESTION 7

Examine the initialization parameter that is set in the PFILE: DB\_CREATE\_FILE\_DEST = '/u01/app/oracle/oradata/'

You execute the following command to create the CDB1. container database (CDB): SQL>CREATE DATABASE CDB1

DEFAULT TABLESPACE users

DEFAULT TEMPORARY TABLESPACE temp

UNDO TABLESPACE undotbs1

ENABLE PLUGGABLE DATABASE SEED

SYSTEM DATAFILES SIZE 125M AUTOEXTEND ON NEXT 10M MAXSIZE UNLIMITED SYS AUX DATAFILES SIZE 100M;

Which three statements are true?

- A. It creates a multitenant container database with a root and a seed pluggable database (PDB) that are opened in read-write and read-only modes, respectively.
- B. The files created for both the root and seed databases use Oracle Managed Files (OMF).
- C. It creates a multitenant container database with the root and seed databases opened and one PDB mounted.
- D. It sets the users tablespace as the default for both the root and seed databases.
- E. undotbs1 is used as the undo tablespace for both the root and seed databases.
- F. It creates a multitenant container database with the root database opened and the seed database mounted.

**Answer:** ABE

#### Explanation:

The seed actually doesn't use anything since it's read-only, but any PDB created from the seed will use the undotbs1 undo tablespace. Each PDB can have its own default tablespace, but cannot change the undo tablespace.

**NEW QUESTION 8**

The following parameters are set for your Oracle 12c database instance: OPTIMIZER\_CAPTURE\_SQL\_PLAN\_BASELINES=FALSE  
OPTIMIZER\_USE\_SQL\_PLAN\_BASELINES=TRUE

You want to manage the SQL plan evolution task manually. Examine the following steps:

1. Set the evolve task parameters.
2. Create the evolve task by using the DBMS\_SPM.CREATE\_EVOLVE\_TASK function.
3. Implement the recommendations in the task by using the DBMS\_SPM.IMPLEMENT\_EVOLVE\_TASK function.
4. Execute the evolve task by using the DBMS\_SPM.EXECUTE\_EVOLVE\_TASK function.
5. Report the task outcome by using the DBMS\_SPM.REPORT\_EVOLVE\_TASK function. Identify the correct sequence of steps.

- A. 2, 4, 5
- B. 2, 1, 4, 3, 5
- C. 1, 2, 3, 4, 5
- D. 1, 2, 4, 5

**Answer:** B

**NEW QUESTION 9**

Your database is running in archivelog mode. Examine the parameters for your database instance: LOG\_ARCHIVE\_DEST\_1='LOCATION=/disk1/arch MANDATORY'

LOG\_ARCHIVE\_DEST\_2='LOCATION=/disk2/arch' LOG\_ARCHIVE\_DEST\_3='LOCATION=/disk3/arch' LOG\_ARCHIVE\_DEST\_4='LOCATION=/disk4/arch'  
LOG\_ARCHIVE\_MIN\_SUCCEED\_DEST = 2

While the database is open, you notice that the destination set by the log\_archive\_dest\_1 parameter is not available. All redo log groups have been used. What happens at the next log switch?

- A. The database instance hangs and the redo log files are not overwritten.
- B. The archived redo log files are written to the fast recovery area until the mandatory destination is made available.
- C. The database instance is shutdown immediately.
- D. The destination set by the log\_archive\_dest parameter is ignored and the archived redo log files are created in the next two available locations to guarantee archive log success.

**Answer:** A

**Explanation:**

Made more logfile switch until all redos groups are full. first log switch succeeds, second also succeeds then next will hang database.

**NEW QUESTION 10**

Identify three scenarios in which RMAN will use backup sets to perform active database duplication.

- A. when the duplicate ... from active database command contains the section size clause
- B. when you perform active database duplication on a database with flashback disabled
- C. when you specify set encryption before the duplicate ... from active database command
- D. when the number of auxiliary channels allocated is equal to or greater than the number of target channels
- E. when you perform active database duplication on a database that has read-only tablespaces

**Answer:** ACD

**Explanation:**

Starting with Oracle Database 12c Release 1 (12.1), RMAN can use backup sets to transfer the source database files that need to be duplicated. The backup sets are transferred over the network to the auxiliary database. Backup sets can be encrypted for additional security. Specify the encryption algorithm by using the SET ENCRYPTION ALGORITHM command before the DUPLICATE command. RMAN uses backup sets to perform active database duplication when the connection to the target database is established using a net service name and any one of the following conditions is satisfied:

The DUPLICATE ... FROM ACTIVE DATABASE command contains either the USING BACKUPSET, USING COMPRESSED BACKUPSET, or SECTION SIZE clause. The number of auxiliary channels allocated is equal to or greater than the number of target channels allocated. <http://docs.oracle.com/database/121/BRADV/rcmdupdb.htm#BRADV298>

**NEW QUESTION 10**

Which two statements are true about recovering logically corrupted tables or table partitions from an RMAN backup?

- A. Tables or table partitions can be recovered by using an auxiliary instance only.
- B. Tables or table partitions with a foreign key cannot be recovered.
- C. Tables or table partitions can be recovered only when the database is in mount state.
- D. Tables or table partitions from the system and sysaux tablespaces cannot be recovered.
- E. Tables with not null constraints cannot be recovered

**Answer:** AD

**Explanation:**

References:

<https://www.pythian.com/blog/table-recovery-with-rman-in-database-12c/> <https://docs.oracle.com/database/121/BRADV/rcmresind.htm#BRADV695>

**NEW QUESTION 15**

Your database is running in archivelog mode and a nightly backup of the database, along with an autobackup of the control file, is taken by using RMAN. Because of a media failure, the SPFILE and the control files are lost.

Examine the steps to restore the SPFILE and the control file to mount the database:

1. Set DBID of the target database in RMAN.
2. Start the database instance by using the STARTUP FORCE NOMOUNT command in RMAN.
3. Restore the control files from the backup.
4. Mount the database.

5. Restore the SPFILE from the autobackup.
6. Create a PFILE from the recovered SPFILE.
7. Restart the instance in NOMOUNT state. Identify the required steps in the correct order.

- A. 1, 2, 5, 3, 6, 4  
B. 1, 2, 3, 5, 6, 4  
C. 2, 1, 5, 7, 3, 4  
D. 2, 1, 5, 6, 7, 4, 3

**Answer:** C

Your database has a table CUSTOMERS that contains the columns CUST\_NAME, AMT\_DUE, and OLD\_STATUS.

Examine the commands executed and their output:

SQL> UPDATE customers SET amt\_due=amt\_due+amt\_due\*.1 WHERE cust\_name='JAMES'; 1 row updated.

SQL> ALTER TABLE customers DROP COLUMN old\_status; Table Altered

SQL> UPDATE customers SET amt\_due=amt\_due+amt\_due\*1.5 WHERE cust\_name='JAMES'; 1 row updated.

SQL> COMMIT;

SQL> SELECT versions\_xid AS XID, versions\_startscn AS START\_SCN, versions\_endcscn AS END\_SCN, versions\_operation AS OPERATION, amt\_due  
FROM customers VERSIONS BETWEEN SCN MINVALUE AND MAXVALUE WHERE  
cust\_name='JAMES';.

XID START\_SCN END\_SCN OPERATION AMT\_DUE

----- 07002f00cl030000 1706337 1706337 U 3300

2018-04-01T12:03:00.71<!--EndFragment-->

Why is it that only one update is listed by the Flashback Version Query?

A. Supplemental logging is not enabled for the database.

B. The undo data that existed for versions of rows before the change to the table structure is invalidated.

DB\_FLASHBACK\_RETENTION\_TARGET parameter is set to a lower value and the undo data pertaining to the first transaction is flushed out.  
D. Undo retention guarantee is not enabled.  
E. Flashback Data Archive is full after the first update statement.

**Answer:** C

#### NEW QUESTION 22

In which three scenarios is media recovery required?

- A. when a tablespace is accidentally dropped from a database
- B. when archived redo log files are lost
- C. when data files are lost
- D. when one of the online redo log members is corrupted
- E. when all control files are lost

**Answer:** ADE

#### Explanation:
