

VMware

Exam Questions 2V0-11.25

VMware Cloud Foundation 5.2 Administrator

NEW QUESTION 1

After deploying the VMware Cloud Foundation management domain, an administrator needs to configure backup for the components within the domain. Which two steps are involved in configuring the backup of VMware Cloud Foundation management components? (Choose two.)

- A. Configure an external SFTP backup repository on the SDDC Manager.
- B. Manually export the NSX configuration to the SDDC Manager.
- C. Enable the vCenter Server snapshot manager on the SDDC Manager.
- D. Install a third-party backup solution on each ESXi host.
- E. Create a backup schedule on the SDDC manager to automate taking regular backups.

Answer: AE

Explanation:

To configure backups for the VMware Cloud Foundation management components, you must set up an external SFTP backup repository within the SDDC Manager. This repository will store the backup files for management components like vCenter, NSX Manager, and SDDC Manager itself. Creating a backup schedule within the SDDC Manager ensures that regular, automated backups are taken, helping to maintain data integrity and recovery options for the management domain.

NEW QUESTION 2

During a routine check, an administrator observes that several VMs are reporting high memory usage in VMware Aria Operations. They need to verify if the high memory usage is due to memory contention. What actions should be taken in VMware Aria Operations to verify this?

- A. Review the CPU ready time
- B. Look at the network throughput
- C. Check the memory usage and ballooning metrics.
- D. Analyze the storage I/O performance.

Answer: C

Explanation:

To verify if high memory usage is due to memory contention, the administrator should check the memory usage and ballooning metrics in VMware Aria Operations. Ballooning occurs when the hypervisor reclaims memory from a virtual machine due to memory contention, and monitoring these metrics can help identify whether the VMs are experiencing memory pressure or being forced to swap memory.

NEW QUESTION 3

An alert in SDDC Manager indicates that the health status of the vSAN cluster is degraded. Which tool within VMware Cloud Foundation should be used to gather detailed logs and perform in-depth troubleshooting for the vSAN issues?

- A. Aria Operations for Logs
- B. SDDC Manager
- C. vCenter Server
- D. Aria Operations for Networks

Answer: A

Explanation:

Aria Operations for Logs (formerly known as vRealize Log Insight) is used to collect, analyze, and troubleshoot logs from various components within VMware Cloud Foundation, including the vSAN cluster. It provides detailed insights into the logs, allowing administrators to perform in-depth troubleshooting of issues like degraded health statuses.

NEW QUESTION 4

What are three prerequisites for deploying an NSX Edge cluster in a VMware Cloud Foundation solution? (Choose three.)

- A. Verify that the NSX host overlay VLAN and NSX Edge overlay VLAN are routed to each other.
- B. Set up vSAN storage policies for the Edge VMs.
- C. Create DNS entries for the NSX Edge nodes.
- D. Install Aria Operations and enable Edge Cluster monitoring.
- E. Assign separate VLAN IDs and subnets for the NSX host overlay and NSX Edge overlay networks.

Answer: ACE

Explanation:

The NSX host overlay VLAN and NSX Edge overlay VLAN need to be routed to each other to ensure proper communication between the host and NSX Edge clusters. DNS entries for the NSX Edge nodes are required to enable name resolution, which is important for the proper functioning of the NSX Edge cluster. Assigning separate VLAN IDs and subnets for the NSX host overlay and NSX Edge overlay networks is necessary to maintain network isolation and optimize traffic flow between components.

NEW QUESTION 5

What is the first step in downloading the vSphere CLI tools to a developer workstation?

- A. Register the developer workstation with the Active Directory.
- B. Install a compatible version of Java Runtime Environment
- C. Visit the VMware Downloads page and locate the vSphere CLI tools.
- D. Configure the workstation's network settings to connect to the vSphere environment.

Answer: C

Explanation:

The first step in downloading the vSphere CLI tools is to visit the VMware Downloads page, where the vSphere CLI tools are available. From there, you can select the appropriate version for your environment and begin the download process.

NEW QUESTION 6

What is the primary symptom of an issue with vSphere HA host states?

- A. VMs are not being migrated using vMotion
- B. Snapshots cannot be created or consolidated
- C. Hosts frequently disconnect from vCenter Server
- D. HA-protected VMs are not restarted after a host failure

Answer: D

Explanation:

vSphere HA (High Availability) is designed to automatically restart virtual machines on other hosts in the cluster in case of a host failure. If there is an issue with vSphere HA host states, the primary symptom is that HA-protected VMs do not restart after a host failure, which indicates a problem with HA configuration or functionality.

NEW QUESTION 7

An administrator successfully removed a host from a VMware vSphere cluster and decommissioned it in SDDC Manager. What must be done before the host can be recommissioned and added back to the SDDC Manager inventory?

- A. Log in to the host console and select "Reset System Configuration" from the ESXi DCUI.
- B. Manually uninstall the NSX VIBs on the host.
- C. From the host console, use the `/sbin/generate-certificates` command to generate a new self-signed certificate.
- D. Reinstall ESXi on the host.

Answer: A

Explanation:

Before the host can be recommissioned and added back to the SDDC Manager inventory, you must reset the system configuration. This can be done from the ESXi Direct Console User Interface (DCUI) by selecting the "Reset System Configuration" option. This will remove any previous configuration and allow the host to be re-added to the environment.

NEW QUESTION 8

Which two SDDC Manager operations can be executed on an NSX Edge cluster after it has been deployed? (Choose two.)

- A. Redeploy
- B. Sync
- C. Expand
- D. Delete
- E. Shrink

Answer: BD

Explanation:

After an NSX Edge cluster has been deployed, you can perform a sync operation to ensure the NSX Edge cluster is in sync with the configuration in SDDC Manager.

Deleting an NSX Edge cluster can be done after it has been deployed if it is no longer required or needs to be removed from the environment.

NEW QUESTION 9

As part of the preparation for deploying VMware Aria Suite Lifecycle, an administrator needs to create Application Virtual Networks (AVNs). Which three steps are necessary to complete the configuration of AVNs? (Choose three.)

- A. Setup routing policies for AVNs.
- B. Configure the AVNs in the NSX Manager.
- C. Assign AVNs to specific ESXi hosts.
- D. Enable AVNs in the vCenter Server.
- E. Define the IP address ranges for the AVNs.

Answer: BCE

Explanation:

Configure the AVNs in the NSX Manager: AVNs (Application Virtual Networks) are configured within NSX Manager to define the network segments and ensure proper network segmentation for workloads.

Assign AVNs to specific ESXi hosts: After configuring the AVNs in NSX Manager, they need to be assigned to the appropriate ESXi hosts to ensure they are properly mapped to the compute resources.

Define the IP address ranges for the AVNs: Each AVN must have an associated IP address range to provide network addressing for the workloads deployed on them.

NEW QUESTION 10

Which option should be chosen when placing a vSAN host into maintenance mode to ensure all data remains accessible during maintenance, while minimizing the time required to complete the operation?

- A. Quick Migration
- B. No Data Migration
- C. Ensure Accessibility
- D. Full Data Migration

Answer: C

Explanation:

When placing a vSAN host into maintenance mode, choosing "Ensure Accessibility" ensures that all data remains accessible during the maintenance operation. It moves data off the host only if necessary, prioritizing accessibility while minimizing downtime. This option is designed to minimize the time required to complete the operation compared to "Full Data Migration."

NEW QUESTION 10

A cloud administrator recently deployed a new VI workload domain. As part of the initial VI domain creation, the administrator created a new SSO domain. However, they reconsidered and now want the domain to use the same SSO domain as the management domain. How can the VI domain be changed from a dedicated SSO domain to sharing the SSO domain with the management domain?

- A. From the SDDC Manager console, use the rsutil command to add the VI workload domain to the management domain SSO ring.
- B. The vSphere SSO domain cannot be changed once it has been deployed and a new VI workload domain that is part of the Management SSO domain must be created, and workloads migrated.
- C. From the VI Workload Domain vCenter Server instance, use the rsutil command to join the management domain SSO ring.
- D. From the Management Domain vCenter Server instance, use the rsutil command to add the VI workload domain to the management domain SSO ring.

Answer: B

Explanation:

Once the vSphere Single Sign-On (SSO) domain is set up for a workload domain, it cannot be changed. If you need the VI workload domain to use the same SSO domain as the management domain, you must create a new VI workload domain that is part of the management domain's SSO ring, and then migrate the workloads to the new domain.

NEW QUESTION 15

A Cloud Administrator has been tasked with verifying all of the prerequisites are in place prior to deploying VMware Aria Suite Lifecycle. The following information has been provided for the Aria Suite Lifecycle implementation:

hostname: lcm

domain: vcf.company.com IP address: 10.0.0.150/24 IP gateway: 10.0.0.1

Which two items must the Cloud Administrator ensure are available prior to deploying VMware Aria Suite Lifecycle? (Choose two.)

- A. An Application Virtual Network is configured in SDDC Manager
- B. A DNS PTR Record for 10.0.0.1 that points to lcm.vcf.company.com
- C. A DNS A Record for lcm.vcf.company.com that points to 10.0.0.150
- D. An allocated IP address for the NSX standalone Tier-1 Gateway
- E. A CA-signed SSL certificate for Aria Suite Lifecycle added to SDDC Manager

Answer: CD

Explanation:

A DNS A record is necessary to resolve the hostname (lcm.vcf.company.com) to the specified IP address (10.0.0.150) so that it can be correctly accessed during the deployment.

A DNS PTR record is required for reverse DNS lookup, which ensures proper identification of the IP address (10.0.0.1) to the hostname (lcm.vcf.company.com), which is important for network validation during the deployment process.

NEW QUESTION 17

What is the primary benefit of creating a VM template in VMware vCenter?

- A. It enables direct physical access to the underlying hardware.
- B. It accelerates the deployment of VMs with predefined configurations.
- C. It provides enhanced network security for VMs.
- D. It simplifies the process of taking snapshots of VMs.

Answer: B

Explanation:

The primary benefit of creating a VM template in VMware vCenter is that it allows for the rapid deployment of virtual machines (VMs) with predefined configurations, including the operating system, installed applications, and other settings. This accelerates the process of provisioning VMs, ensuring consistency and saving time during deployment.

NEW QUESTION 18

Which three tasks are performed by Cloud Builder during the bring-up process of a VMware Cloud Foundation solution? (Choose three.)

- A. SDDC manager deployment
- B. NSX Edge cluster deployment
- C. Aria Suite Lifecycle Manager deployment
- D. vVols storage configuration for all management hosts
- E. vSphere HA/DRS cluster creation and configuration
- F. vCenter and NSX Manager cluster deployment

Answer: ABF

Explanation:

Cloud Builder deploys the SDDC Manager, which is responsible for managing and automating the VMware Cloud Foundation environment. Cloud Builder deploys the NSX Edge cluster as part of the network configuration during the bring-up process. Cloud Builder also deploys the vCenter and NSX Manager clusters to ensure proper management and network virtualization for the VMware Cloud Foundation environment.

NEW QUESTION 23

An administrator is tasked with troubleshooting an issue where some VMs are not appearing in the vCenter inventory after a recent migration to a new vSphere environment.

Which two components should the administrator examine to resolve this issue? (Choose two.)

- A. The storage policies applied to the VMs.
- B. The network settings of the new vSphere environment.
- C. The compatibility of the VM hardware version with the new vSphere environment.
- D. The registration status of the VMs in the new vSphere environment.
- E. The vSphere permissions assigned to the VMs.

Answer: CD

Explanation:

If the hardware version of the virtual machines is incompatible with the new vSphere environment, the VMs may not appear or may fail to register properly.

Ensuring compatibility between the VM hardware version and the vSphere environment is essential for successful VM migration.

If the VMs are not correctly registered in the new vSphere environment after migration, they won't show up in the vCenter inventory. Checking the registration status helps to identify if this is the issue.

NEW QUESTION 27

What is the primary purpose of configuring Role-Based Access Control (RBAC) in vCenter?

- A. To ensure vCenter runs on multiple operating systems.
- B. To provide a method for vCenter to communicate with ESXi hosts.
- C. To manage user access and permissions within the vCenter environment.
- D. To enable vCenter integration with external storage systems.

Answer: C

Explanation:

Role-Based Access Control (RBAC) in vCenter is used to define and manage user roles and permissions. It allows administrators to control who can access specific resources and perform actions within the vCenter environment. RBAC ensures that users only have access to the areas and tasks they are authorized to interact with, enhancing security and management.

NEW QUESTION 31

An administrator's passwords for their NSX 'root', 'admin', and 'audit' accounts in the Cloud Foundation management domain expired. The administrator logged into the NSX Manager console and changed the passwords for all three accounts. The passwords are now showing a status of "Disconnected" in the SDDC Manager UI.

- A. In order to correct this issue, how can SDDC Manager be updated with the new passwords?
- B. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Rotate.
- C. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Sync.
- D. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Remediate.

Answer: B

Explanation:

To resolve the issue of disconnected accounts in SDDC Manager after password changes, the administrator must navigate to the Password Management section in the SDDC Manager UI. From there, the administrator can select the affected account, click the vertical ellipsis (three dots), and choose Update to enter the new password for that account, ensuring SDDC Manager is synced with the correct credentials.

NEW QUESTION 36

Which feature of VMware Lifecycle Manager allows an administrator to manage the lifecycle of ESXi hosts by applying a consistent image across the hosts in a cluster?

- A. Host Profiles
- B. Lifecycle Manager Images
- C. Update Manager Baselines
- D. vSphere Auto Deploy

Answer: B

Explanation:

VMware Lifecycle Manager (vLCM) enables administrators to manage the lifecycle of ESXi hosts by applying a consistent image across the hosts in a cluster. These images include the ESXi version, firmware, drivers, and settings, ensuring consistency and simplifying updates and patches across all hosts in a cluster.

NEW QUESTION 38

An administrator is preparing to deploy VMware Aria Suite Lifecycle using SDDC Manager. Which three are prerequisites for deploying Aria Suite Lifecycle? (Choose three.)

- A. Ensure that a custom SSL certificate specifying the FQDN of the appliance is available.
- B. Ensure that the NTP and DNS settings specified in SDDC Manager are valid for all management components.
- C. Verify that the password for the admin(g>local user account meets the complexity requirements.
- D. Ensure that the Application Virtual Networks have been configured.
- E. Ensure the VMware Software Install Bundle for VMware Aria Suite Lifecycle is in the local bundle repository.

Answer: ABE

Explanation:

Ensure that a custom SSL certificate specifying the FQDN of the appliance is available: A custom SSL certificate for the FQDN of the Aria Suite Lifecycle appliance is required for secure communication between components.

Ensure that the NTP and DNS settings specified in SDDC Manager are valid for all management components: Accurate NTP and DNS settings are crucial for time synchronization and proper domain resolution in the environment.

Ensure the VMware Software Install Bundle for VMware Aria Suite Lifecycle is in the local bundle repository: The required software bundle must be available in the local repository to ensure successful deployment.

NEW QUESTION 39

An administrator needs to ensure that their VMware Cloud Foundation-based private cloud solution can support multi-tenancy for different departments within their organization.

What two configurations and components are necessary to achieve this? (Choose two.)

- A. Configure vSAN storage policies for each department.
- B. Use vSphere Resource Pools to allocate resources to different departments.
- C. Deploy Aria Automation to enable self-service provisioning for tenants.
- D. Use NSX to create isolated network segments for each tenant.

Answer: BD

Explanation:

vSphere Resource Pools allow for the allocation of CPU, memory, and storage resources to different departments (tenants) within the VMware Cloud Foundation environment. This ensures that each department has its own dedicated resources, preventing resource contention between them.

NSX can be used to create isolated network segments (logical networks) for each tenant, ensuring network security and segmentation between departments. Each department can have its own isolated network environment.

NEW QUESTION 41

An organization is integrating VMware vCenter with Active Directory (AD) to streamline user authentication. As part of this process, the administrator needs to add AD as an identity source in vCenter.

Which three steps must be performed to successfully add AD as an identity source? (Choose three.)

- A. Enter the Domain Name and the credentials of an AD user with domain join privileges
- B. Configure DNS settings on all ESXi hosts to point to the AD DNS servers.
- C. Select 'Add Identity Source' and choose 'Active Directory (Integrated Windows Authentication)'
- D. Reboot the vCenter Server to apply the identity source settings.
- E. Navigate to the vCenter Single Sign-On configuration in the vSphere Client.

Answer: ACE

Explanation:

When adding AD as an identity source, you need to enter the Domain Name and provide the credentials of an AD user with domain join privileges to authenticate and add the domain.

In the vSphere Client, you need to select 'Add Identity Source' and choose the appropriate method for AD integration, which is typically 'Active Directory (Integrated Windows Authentication)'.

The process to add AD as an identity source is performed under the vCenter Single Sign-On (SSO) configuration in the vSphere Client.

NEW QUESTION 43

A disk failure has occurred in a vSAN cluster.

What four steps should be taken to recover from this disk failure? (Choose four.)

- A. Use the vSphere Client to check the vSAN Health Service
- B. Disable disk group encryption
- C. Rebuild the affected disk group
- D. Perform a full resync of the vSAN objects
- E. Replace the failed disk with a new one
- F. Ensure the new disk is claimed by the vSAN cluster

Answer: ACEF

Explanation:

Checking the vSAN Health Service in the vSphere Client is the first step in diagnosing the issue and verifying the status of the vSAN components after the disk failure.

Rebuilding the affected disk group is necessary to ensure that data is re-optimized and replicated in accordance with the vSAN policy.

Replacing the failed disk with a new one ensures that the storage capacity is restored. Ensuring that the new disk is claimed by the vSAN cluster is important to ensure that it is recognized and integrated into the vSAN disk group.

NEW QUESTION 46

An administrator is tasked with performing password rotation for VMware Cloud Foundation components managed by SDDC Manager.

Which action must be taken to complete this task?

- A. Use the Async Patch CLI Tool to rotate passwords for all components.

- B. Schedule a maintenance window to rotate the passwords to minimize disruption.
- C. Manually update the passwords in vCenter Server and NSX Manager.
- D. Access the SDDC Manager UI and navigate to the password management section.

Answer: D

Explanation:

Password rotation for VMware Cloud Foundation components is managed via the SDDC Manager UI. In the password management section of the SDDC Manager, administrators can rotate the passwords for various components like vCenter Server, NSX Manager, and other management components.

NEW QUESTION 48

An IT team needs to ensure compliance and security for various database workloads managed by Data Services Manager. Which three features of Data Services Manager should be leveraged to achieve this? (Choose three.)

- A. Automated patch management for database instances.
- B. Integration with NSX for network security policies.
- C. Encryption of data at rest and in transit.
- D. Role-based access control (RBAC) to restrict database access.
- E. vSphere DRS for resource scheduling.

Answer: ACD

Explanation:

Automated patch management ensures that database instances are kept up-to-date with the latest patches, which is essential for maintaining compliance and security. Encryption of data at rest and in transit helps protect sensitive database data from unauthorized access and tampering, ensuring compliance with security standards.

Role-based access control (RBAC) restricts database access based on user roles, ensuring that only authorized users have access to sensitive data, which is crucial for compliance and security.

NEW QUESTION 50

DRAG DROP

Match each networking issue with the corresponding troubleshooting step.

Issues

Host in Isolation Response	
Host in Failover State	
Host in Unreachable State	

Troubleshooting Steps

- Examine NIC teaming and load balancing configuration
- Verify the port group settings and VLAN configuration
- Check physical network cables and switch port status

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Issues

Host in Isolation Response	Host in Isolation Response
Host in Failover State	Host in Failover State
Host in Unreachable State	Host in Unreachable State

Troubleshooting Steps

- Examine NIC teaming and load balancing configuration
- Verify the port group settings and VLAN configuration
- Check physical network cables and switch port status

NEW QUESTION 54

A company plans to enhance its DevOps practices by implementing Kubernetes as part of VMware Cloud Foundation environment. Which three steps should an administrator complete to achieve this integration? (Choose three.)

- A. Deploy HCX to migrate existing VMs to Kubernetes.
- B. Configure Aria Automation to automate the deployment of Kubernetes clusters.

- C. Deploy NSX to manage the networking for Kubernetes clusters.
- D. Configure vSAN to provide storage for Kubernetes workloads.
- E. Enable IaaS Control Plane on existing vSphere clusters.

Answer: BCD

Explanation:

Aria Automation (formerly vRealize Automation) can be configured to automate the deployment of Kubernetes clusters, which aligns with DevOps practices by enabling the self-service and automation of Kubernetes infrastructure.

NSX is used to manage networking for Kubernetes clusters, providing features such as network segmentation and micro-segmentation, which are essential for secure and scalable Kubernetes deployments.

vSAN provides the storage infrastructure for Kubernetes workloads, offering distributed and scalable storage that integrates with Kubernetes.

NEW QUESTION 58

What is the primary purpose of configuring a Virtual Distributed Switch (VDS) in a vSphere environment?

- A. To automate the deployment of virtual machines.
- B. To provide centralized management of network configurations across multiple ESXi hosts.
- C. To manage storage policies for datastores.
- D. To enable VM snapshots across multiple datastores.

Answer: B

Explanation:

A Virtual Distributed Switch (VDS) in a vSphere environment enables centralized management of network configurations across multiple ESXi hosts. It simplifies network administration by allowing the administrator to configure network settings, such as VLANs, port groups, and policies, for multiple hosts at once, ensuring consistency and scalability.

NEW QUESTION 63

While deploying a new VMware Cloud Foundation environment, a cloud administrator validates the information entered into the Deployment Parameter Workbook. The validation action results in an error and the VMware Cloud Builder GUI error message does not identify the cause.

Which logfile can the administrator use to identify the cause of the validation error?

- A. VMware SDDC Manager appliance - vcf-deployment-debug.log
- B. VMware Cloud Builder appliance - vcf-bringup-debug.log
- C. VMware SDDC Manager appliance - vcf-bringup-debug.log
- D. VMware Cloud Builder appliance - vcf-deployment-debug.log

Answer: D

Explanation:

The vcf-deployment-debug.log file on the VMware Cloud Builder appliance contains detailed logs related to the deployment process, including any validation errors. This log will help identify the cause of the error during the deployment validation phase.

NEW QUESTION 65

A host in a vSphere environment needs to be taken offline for hardware maintenance. An administrator needs to put the host in maintenance mode without causing VM downtime.

What three steps should the administrator follow? (Choose three.)

- A. Select the "Fractional data migration" option
- B. Migrate all VMs off the host using vMotion
- C. Verify that no VMs are running on the host before maintenance
- D. Select the host and enter maintenance mode from the vSphere Client
- E. Ensure that the host is not part of a vSphere HA cluster

Answer: BDE

Explanation:

Using vMotion to migrate all virtual machines off the host ensures that there is no downtime for the VMs during the maintenance process.

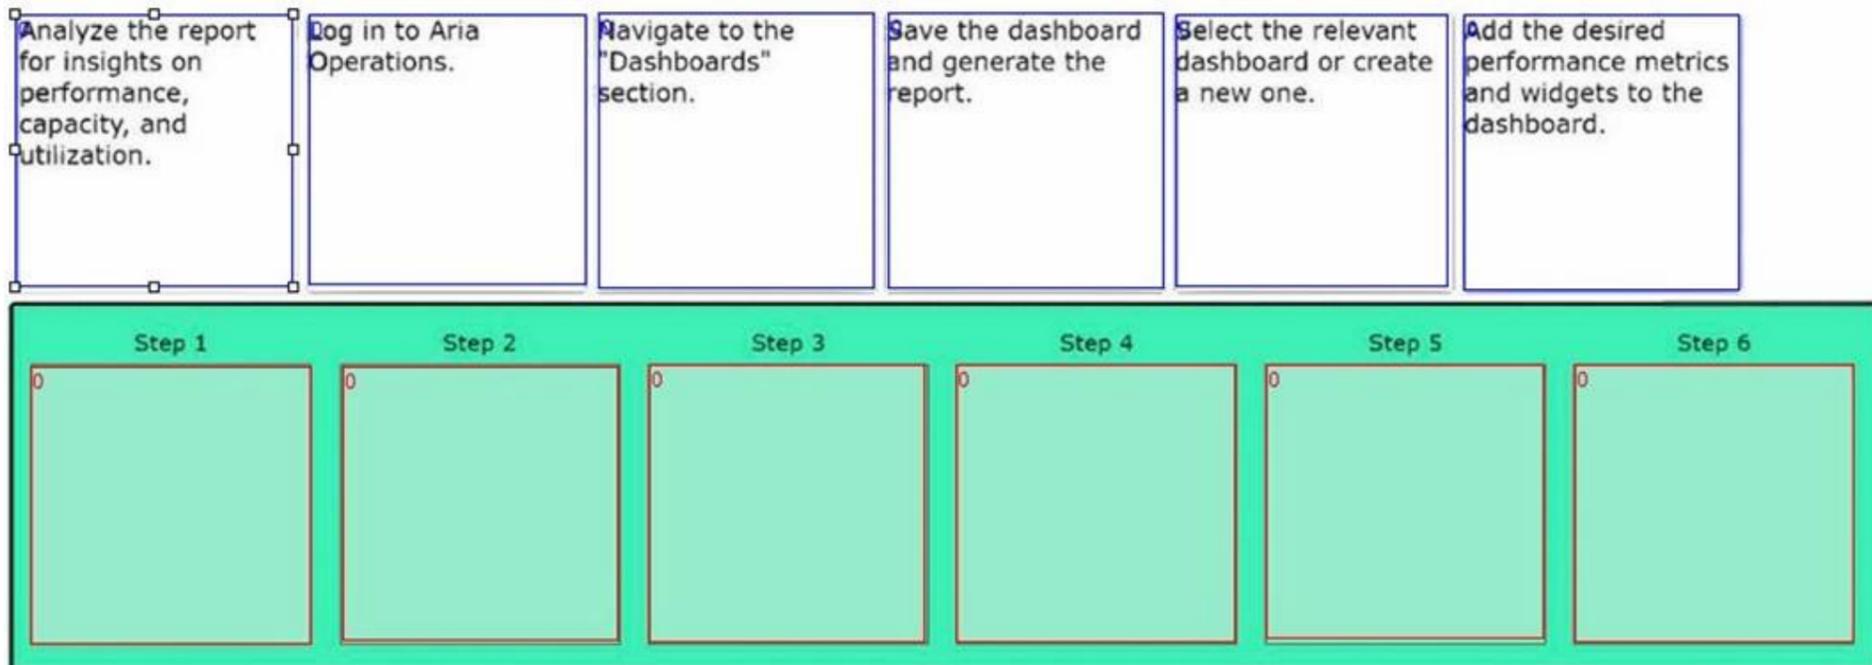

The administrator should then select the host and initiate maintenance mode from the vSphere Client to begin the maintenance process.

Ensuring the host is not part of a vSphere HA cluster before maintenance is important to avoid triggering unnecessary VM restarts or failovers during the process.

NEW QUESTION 69

DRAG DROP

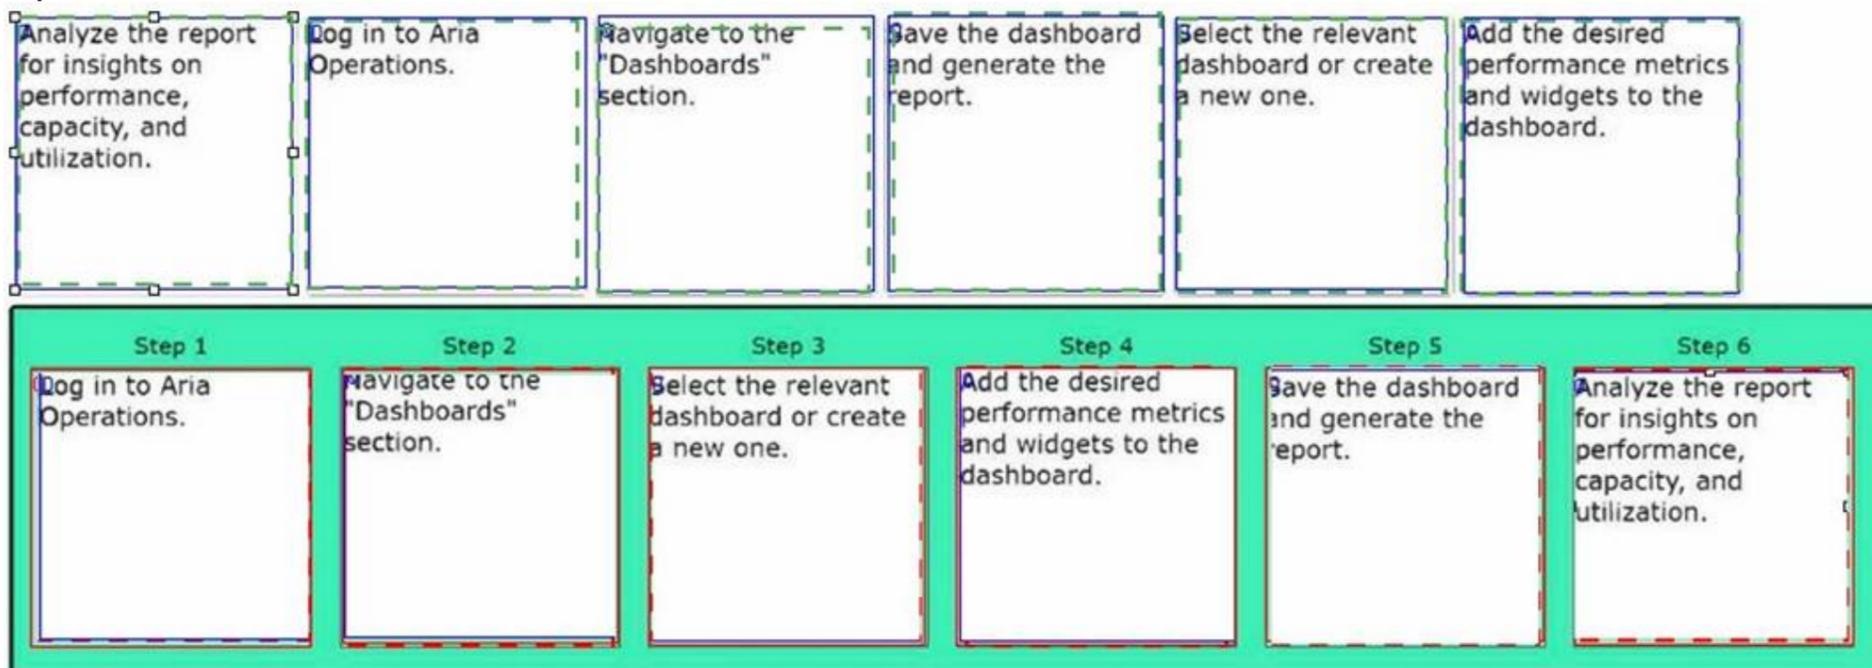

Arrange the steps in the correct order to generate a performance report in Aria Operations.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

NEW QUESTION 71

An administrator needs to create a custom role in vCenter Server that is part of VMware Cloud Foundation environment to grant specific privileges to a group of users.

Which two actions should be taken to create this custom role? (Choose two.)

- A. Choose the privileges required for the custom role.
- B. Navigate to the Roles section in the vSphere Client.
- C. Apply the custom role to the root of the vCenter Server inventory.
- D. Assign permissions to the custom role before adding privileges.
- E. Clone an existing role in SDDC Manager to create the custom role.

Answer: AB

Explanation:

When creating a custom role, it is essential to choose the appropriate privileges that the role will require. These privileges define what actions the users in the role can perform. To create and manage roles, you need to navigate to the "Roles" section in the vSphere Client. This is where roles are defined and assigned within the vCenter Server.

NEW QUESTION 72

A newly added ESXi host is not able to communicate with the vCenter Server.

What three steps should an administrator take to diagnose and resolve this issue? (Choose three.)

- A. Verify the network configuration on the ESXi host
- B. Check the license on the ESXi host
- C. Use the vSphere Client to review the host's network settings
- D. Ensure that the management network is correctly configured and reachable
- E. Restart the management agents on the ESXi host

Answer: ADE

Explanation:

Verifying the network configuration on the ESXi host ensures that the host is correctly configured for network communication with the vCenter Server. The management network must be properly configured and reachable from the ESXi host to communicate with the vCenter Server. Restarting the management agents on the ESXi host can resolve issues related to communication between the ESXi host and vCenter Server, as sometimes the agents might become unresponsive.

NEW QUESTION 74

The administrator of a VMware Cloud Foundation environment notices that log data from multiple components, including vSphere, NSX, and vSAN, is not being collected properly in Aria Operations for Logs. What two steps should the administrator perform to resolve this issue? (Choose two.)

- A. Check the network connectivity between the Aria Operations for Logs server and the VMware Cloud Foundation components.
- B. Increase the storage capacity of the Aria Operations for Logs server to accommodate more log data.
- C. Reconfigure the log level settings on all vSphere components to ensure detailed logging.
- D. Verify that the Aria Operations for Logs license is still valid and active.
- E. Ensure that the syslog configuration on each ESXi host is pointing to the correct Aria Operations for Logs server.

Answer: AE

Explanation:

Ensuring network connectivity between the Aria Operations for Logs server and VMware Cloud Foundation components is crucial. If there are network connectivity issues, logs may fail to be transmitted to the Aria Operations for Logs server. The syslog configuration on each ESXi host must be set correctly to point to the Aria Operations for Logs server to ensure that log data from ESXi hosts is collected and sent to the log management system.

NEW QUESTION 79

An administrator needs to secure an ESXi host in their environment by enabling lockdown mode. What two steps should be taken to secure the ESXi host using lockdown mode? (Choose two.)

- A. Navigate to the host's settings in the vSphere Client.
- B. Enable "Strict Lockdown Mode" to restrict all direct access to the host.
- C. Reboot the host to apply the lockdown settings.
- D. Add the host to a dedicated security group in Active Directory.
- E. Disable SSH and the ESXi Shell.

Answer: AB

Explanation:

To enable lockdown mode, you first need to navigate to the ESXi host's settings in the vSphere Client, where you can configure security settings such as lockdown mode. Enabling "Strict Lockdown Mode" restricts all direct access to the ESXi host, ensuring that only authorized users can manage the host through vCenter and preventing direct login via the ESXi console or SSH.

NEW QUESTION 84

What are the steps to apply software updates in a VMware Cloud Foundation deployment using the VMware Async Patch CLI Tool?

- A. Upload the patch bundle to SDDC Manager, download the confirmation, and then apply the patch.
- B. Apply the patch directly in the VMware SDDC Manager UI from the Software Depot.
- C. Download the patch bundle, upload the bundle to SDDC Manager, and then apply the patch.
- D. Download the patch bundle, apply the patch directly, and then upload the confirmation to SDDC Manager.

Answer: C

Explanation:

To apply software updates in a VMware Cloud Foundation deployment using the VMware Async Patch CLI Tool, the process involves downloading the patch bundle, uploading it to SDDC Manager, and then using the appropriate commands or tools to apply the patch. This ensures that the patch is properly staged in the environment and applied to the necessary components.

NEW QUESTION 87

An administrator needs to deploy a Kubernetes cluster on a vSphere IaaS control plane (formerly vSphere with Tanzu) to host a new application. Which three steps should be followed to successfully deploy the Kubernetes cluster? (Choose three.)

- A. Configure a Load Balancer for the Kubernetes control plane nodes.
- B. Create a new VM template for the Kubernetes nodes.
- C. Configure a vSphere Namespace and assign resource quotas.
- D. Enable Workload Management on the vSphere Cluster.
- E. , Deploy a vSphere Pod Service.

Answer: ACD

Explanation:

A Load Balancer is needed for the Kubernetes control plane nodes to distribute traffic across the control plane and ensure high availability for the Kubernetes management layer. A vSphere Namespace must be configured to define a logical boundary for Kubernetes workloads, and resource quotas help ensure that resources are allocated appropriately for the workloads. Enabling Workload Management on the vSphere Cluster is necessary to integrate Kubernetes with vSphere and manage the lifecycle of Kubernetes clusters using vSphere with Tanzu.

NEW QUESTION 91

DRAG DROP

Put the following steps in the correct order to update the driver/firmware in vSAN.

- Verify that the new driver and firmware versions are active and the host is functioning correctly.
- Download the latest driver and firmware from the hardware vendor's website.
- Apply the firmware update to the host using the vendor's update tool.
- Plan for a maintenance window to perform the update.
- Check the current driver and firmware versions using the vSphere Client.
- Reboot the host to complete the update process.
- Update the driver using the vSphere Lifecycle Manager (vLCM)

- Step 1
- Step 2
- Step 3
- Step 4
- Step 5
- Step 6
- Step 7

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

- Verify that the new driver and firmware versions are active and the host is functioning correctly.
- Download the latest driver and firmware from the hardware vendor's website.
- Apply the firmware update to the host using the vendor's update tool.
- Plan for a maintenance window to perform the update.
- Check the current driver and firmware versions using the vSphere Client.
- Reboot the host to complete the update process.
- Update the driver using the vSphere Lifecycle Manager (vLCM)

- Plan for a maintenance window to perform the update.
- Check the current driver and firmware versions using the vSphere Client.
- Download the latest driver and firmware from the hardware vendor's website.
- Apply the firmware update to the host using the vendor's update tool.
- Update the driver using the vSphere Lifecycle Manager (vLCM)
- Reboot the host to complete the update process.
- Verify that the new driver and firmware versions are active and the host is functioning correctly.

NEW QUESTION 94

An administrator has deployed a new VMware Cloud Builder appliance using the downloaded OVF file. While attempting to use the VMware Cloud Builder

interface, the administrator discovers that no connection can be established to the appliance.
Which three configuration errors may have occurred? (Choose three.)

- A. VLAN misconfiguration.
- B. Incorrect DNS settings or inaccessible DNS servers.
- C. Incorrect NTP settings or inaccessible NTP servers.
- D. Incorrect Static IP configuration.
- E. BGP routing misconfiguration.
- F. Incorrect Dynamic IP configuration.

Answer: ABD

Explanation:

A VLAN misconfiguration could prevent proper network connectivity, particularly if the appliance is not in the correct VLAN or if there is a misalignment in network segmentation. Incorrect DNS settings or inaccessible DNS servers can prevent the VMware Cloud Builder appliance from being able to resolve hostnames, leading to connection issues.

Incorrect Static IP configuration would result in the appliance being unreachable because it won't have the correct IP address or network configuration to communicate with other components.

NEW QUESTION 97

An organization wants to centralize its VM templates, ISO images, and scripts to streamline deployment processes across multiple sites using Content Libraries. Which three steps are required to create a new Content Library? (Choose three.)

- A. Configure the library to automatically sync with the vSphere Update Manager.
- B. Choose "Create a new library" and enter a name and description for the library.
- C. Select "Local content library" and choose the datastore to store the library contents.
- D. Navigate to the Content Libraries section in the vSphere Client.
- E. Add the necessary permissions to allow users to upload content to the library.

Answer: BCD

Explanation:

When creating a new Content Library, you first need to specify a name and description to define the library's purpose.

For a Local Content Library, you need to choose the datastore where the library contents will be stored. This is essential for proper organization and accessibility of content.

To create and manage content libraries, you must navigate to the Content Libraries section in the vSphere Client.

NEW QUESTION 100

What is the primary purpose of configuring VM storage policies in a VMware vSphere environment?

- A. To manage network traffic between VMs.
- B. To enforce specific storage requirements such as performance, availability, and redundancy.
- C. To configure CPU and memory reservations for VMs.
- D. To automate the backup of virtual machines.

Answer: B

Explanation:

The primary purpose of configuring VM storage policies in a VMware vSphere environment is to enforce specific storage requirements such as performance, availability, and redundancy. These policies help ensure that virtual machines are placed on datastores that meet the desired service levels and characteristics.

NEW QUESTION 105

A. The FQDN of the Aria Suite Lifecycle appliance

- A. The FQDN of the Aria Suite Lifecycle cluster
- B. A free IP address on the VMware NSX Tier 0
- C. The password for the root account
- D. A free IP Address within the cross-region virtual network segment
- E. The password for the vcfadmin@local account
- F. The password for the admin@local account

Answer: ABDF

Explanation:

The fully qualified domain name (FQDN) of the Aria Suite Lifecycle appliance and cluster are necessary for proper configuration and integration within the VMware Cloud Foundation environment.

The password for the root account is required to authenticate and provide administrative access to the environment.

The password for the vcfadmin@local account is needed to perform administrative tasks related to VMware Cloud Foundation (VCF).

NEW QUESTION 107

An administrator is responsible for monitoring the logs of multiple vSphere components using VMware Aria Operations for Logs. They notice an increase in error logs for a specific ESXi host.

Which two steps should be taken to pinpoint the issue? (Choose two.)

- A. Restart the ESXi host to resolve the issue immediately
- B. Filter the logs by the ESXi host name and error severity.
- C. Correlate the error logs with recent configuration changes on the ESXi host.
- D. Check for patterns or repeated error messages over a specific time frame.
- E. Delete all old logs to free up space and generate new logs.

Answer: BD

Explanation:

Filtering the logs by the ESXi host name and error severity helps narrow down the logs to those relevant to the specific host and allows for easier identification of significant errors. Checking for patterns or repeated error messages over a specific time frame helps identify the root cause of the issue and determine if the errors are linked to a specific event or condition.

NEW QUESTION 111

Which VMware vSphere feature provides the ability to define and apply datastore capabilities to ensure virtual machines meet specific performance and availability requirements?

- A. Storage Policy Components
- B. Storage Policies
- C. Performance Service
- D. Host Profiles

Answer: B

Explanation:

Storage Policies in VMware vSphere allow administrators to define and apply specific storage requirements for virtual machines, ensuring they meet desired performance and availability standards. These policies enable the alignment of VM storage needs with the capabilities of the underlying datastores.

NEW QUESTION 113

An administrator has a requirement to share the contents of a Content Library across multiple vCenter instances. What steps should the administrator perform to meet this requirement?

- A. Create a Subscribed content library on a single vCenter instance and perform a synchronization
- B. Create a Subscribed content library on each vCenter instance and enable publishing
- C. Create a Local content library on each vCenter instance and perform a synchronization
- D. Create a Local content library on a single vCenter instance and enable publishing

Answer: D

Explanation:

To share the contents of a Content Library across multiple vCenter instances, you need to create a Local content library on one vCenter instance and enable publishing. This allows the library to be accessible by other vCenter instances, where they can subscribe to it, ensuring the content is shared.

NEW QUESTION 115

An administrator is tasked with enabling Workload Management (vSphere IaaS control plane) on a VMware Cloud Foundation workload domain. Which three of the following are prerequisites for enabling Workload Management? (Choose three.)

- A. Ensure that the cluster has at least three ESXi hosts.
- B. Configure NTP and DNS settings for all management components.
- C. Install the vSphere Client on all ESXi hosts.
- D. Verify that all ESXi hosts are running vSphere 7.0 or later.

Answer: ABD

Explanation:

For Workload Management in VMware Cloud Foundation, a minimum of three ESXi hosts is required to create a robust, highly available vSphere cluster. Proper NTP and DNS configuration is essential to ensure time synchronization and proper resolution of network names, which are critical for Workload Management.

The hosts must be running vSphere 7.0 or later to be compatible with the latest features and requirements for Workload Management.

NEW QUESTION 116

.....

Thank You for Trying Our Product

We offer two products:

1st - We have Practice Tests Software with Actual Exam Questions

2nd - Questions and Answers in PDF Format

2V0-11.25 Practice Exam Features:

- * 2V0-11.25 Questions and Answers Updated Frequently
- * 2V0-11.25 Practice Questions Verified by Expert Senior Certified Staff
- * 2V0-11.25 Most Realistic Questions that Guarantee you a Pass on Your FirstTry
- * 2V0-11.25 Practice Test Questions in Multiple Choice Formats and Updatesfor 1 Year

100% Actual & Verified — Instant Download, Please Click
[Order The 2V0-11.25 Practice Test Here](#)
